DETAILED ACTION

Election/Restrictions

Claim 4 is withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim.

Election was made **without** traverse in Paper No. 13.

Drawings

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the shaft having a smooth form must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-3 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Greenway (U. S. Pat. 5,649,349) in view of Hickey (U. S. Pat. 4,136,296).

Greenway discloses a rotor for a machine comprising:

a multiplicity of armature laminations (10) axially one behind the other, which are provided with a locating bore (16) and are connected non-displaceable to one another by holding to form an armature core, which as a whole is pushed onto a motor shaft, wherein

the locating bore (16) of each armature lamination (10) is arranged slightly eccentrically (figure 1) in the armature lamination (10); and wherein

the individual armature laminations (10) of the armature core or groups of armature laminations are arranged such that they are turned in relation to one another by at least one pole pitch or the locating bore (16) is formed as a contoured locating hole.

Greenway discloses that each armature lamination (10) is arranged on the motor shaft such that it is turned with respect to the adjacent the armature lamination by 45° (column 7, lines 58-63).

However, Greenway does not disclose that the motor shaft is of a smooth form.

Hickey discloses a DC machine in which the motor shaft (31) is of a smooth form for the purpose of holding the laminations under pressure.

It would have been obvious at the time the invention was made to modify the rotor of Greenway and provide it with shaft configuration disclosed by Hickey for the purpose of holding the laminations under pressure.

Referring to claim 1, no patentable weight has been given to the method of manufacturing limitations (i. e. pushed as a whole onto the motor shaft) since "even though product-by-process claims are limited by and defined by the process,

determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." *In re Thorpe*, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985)
